

UserBooth allows you to add a virtual photo booth on your website. Let your users take snapshots of themselves for avatars or content directly from the website. The UserBooth application is powered by Adobe Flash and PHP so it's extremely easy to install on your server, and include it in your user interface.

The above widget is populated with random images from the [UserBooth demo](#) database. If you want us to remove your picture from the database, just [contact us](#) specifying the photo name.
